Telstra Health's cloud hosted option

Telstra Health's cloud hosted option

Telstra Health's cloud hosted option provides aged care organisations with a more cost-effective, more secure and future proofed alternative to internal hosting.

To help ensure your data is stored more securely within Australia in line with health data protection laws, Telstra Health is proud to offer hosting via Microsoft's trusted Azure cloud platform.

Benefits of Telstra Health's cloud hosted option

A more cost-effective solution

Telstra Health's cloud-hosted software can help to reduce the total cost of ownership, with the ability to perform secure software upgrades without the financial and time constraints of a full upgrade implementation. By utilising Telstra Health's cloud hosted option, the barriers to implementing or upgrading software are reduced, as there is no need for expensive new infrastructure or an upgrade to current servers to keep up with software advancements. Cloud hosted software can also help reduce the operating costs associated with large scale servers, such as expert staff and large energy consumption bills.

Unique Microsoft experience

The Microsoft Azure platform offers a wealth of cloud services, including data management, web applications, infrastructure services, development and virtual machine testing, storage, backup, and recovery services.

Azure Geo includes geographically redundant regions in New South Wales and Victoria, which helps to ensure all data is stored more securely within Australia in line with health data protection laws, with high availability, disaster recovery and backup options.

Better secured data storage

Microsoft spends around $1 billion on cloud security each year, and employ a team dedicated to eliminating any potential threats. Small and medium aged care providers typically have very minimal or outdated security practices around their data and hosting and patching of their servers – as a result, moving to the cloud is often a security upgrade – powered by Microsoft and supported locally by Telstra Health.

Faster implementations

In selecting Telstra Health's cloud-based option, providers do not require the same level of hardware or human resources as there is no installation process, often resulting in a significant reduction in cost and time. With cloud-based software, the advantages of the system can be felt sooner, so that providers can concentrate their time and resources on providing care, not on lengthy installations.

Ability to scale

Providers require a scalable hosting option that will help to enable their systems to grow as their business does. Telstra Health's cloud-based solutions are simple to scale to meet increased demand while maintaining optimal performance and response times.

Regular upgrades without the downtime

By offering cloud-based software, Telstra Health can schedule small updates regularly with little or no impact on the user. These updates are done in the cloud, without the constraints of traditional deployment. With the ability to perform minor updates on a regular basis, cloud computing keeps software current; without the time and training associated with a full upgrade implementation.

Future proof your investment

Choosing Telstra Health's cloud hosted option helps reduce your need to regularly review and upgrade infrastructure to keep up with future software advancements. Reducing these overheads can result in more money to help deliver services to your care recipients.
